

PRODUCT INFORMATION

SSE ProSight For setting the angle of a line array

Product Code: SP-PROSIGHT

Designed by SSE Audio Group, ProSight is an easy-to-operate device that helps you to set the hanging angle of a line array. It is used by major PA rental companies and sound system manufacturers worldwide.

ProSight consists of two small units - a laser **Sender Unit** and a **Meter Unit** - linked by a cable. The sender unit is mounted on the bumper or the top box of the line array (a variety of mounting brackets are available) and measures the top angle of the box.

The Meter Unit contains a backlit display and is operated with two buttons and a series of menus. It is powered with 6 AA batteries.

The unit displays the angle of the array to the nearest 10th of a degree. It will even provide an accurate measurement when the array is swinging – automatically displaying the centre of the swing.

A Visual Check

As the laser Sender Unit is also equipped with a high powered laser it is useful for providing a visual reference of where the top box is pointing. The Green laser is clearly visible in virtually any location and so offers reassurance that all the sums you did on the laptop were correct and the top box is pointing where it should be.

You can use any number of Sender Units with one Meter Unit. Calibration information is stored in the Sender Unit and remains accurate after the Meter Unit is disconnected.

The Sender Unit can be re-calibrated on the fly to any angle within its range from the Meter Unit, allowing adjustment of the PA elevation to be made in relative values if required.

Rugged packaging

ProSight units are built into extruded aluminium casings, with all controls and displays recessed to ensure reliable performance and long service life.

Prices

PROSLST Sender Unit (inc 30m Cable) List Price: **£630.00**

PROSMMT Meter Unit List Price: **£395.00**

GTB Mounting kit for Nexo GeoT, GeoD & d&b J Series List Price: **£17.85**
